Unidades Comunes Científico Técnicas – SGSAFI-ISCIII

28 al 31 octubre 2024, 6ª Edición  
Programa Formación Continua, ISCIII

# Assembly

Reconstruct the sequence of the original DNA from shorter DNA sequences or small fragments known as reads

- ***De novo***: with no previous knowledge of the genome to be assembled. It overlap the end of the end of each read in order to create a longer sequence.
- ***Assembly with reference***: A similar but not identical genome guides the assembly process. Map reads over supplied genome.

# Assembly: contig y scaffold

- **Contig:** continuous sequence made up of overlapping shorter sequences
- **Scaffold:** two or more contigs located and rearranged according to spatial information (pair-end, mate pair, reference)

<https://www.biostars.org/p/253222/>

# Assembly: gaps

- **Sequencing gaps:** Position and orientation known by spatial information
- **Physical gaps:** No information about adjacent contigs

# Assembly: Algorithms

- **Overlap, Layout, Consensus (OLC - overlap graph):**
  - O - first overlaps among all the reads are found
  - L - then it carries out a layout of all the reads and overlaps information on a graph
    - Removes redundant and low quality overlaps
  - C - and finally the consensus sequence is inferred

Ex. Newbler, Mira, Celera Assembler, CAP3, PCAP, Phrap, Phusion.

X: CTCGGCCCTAGG

TAGATTACACAGATTACTGA TTGATGGCGTAA CTA TAGATTACACAGATTACTGACTTGATGGCGTAACTA TAG TTACACAGATTATGACTTCATGGCGTAA CTA TAGATTACACAGATTACTGACTTGATGGCGTAA CTA TAGATTACACAGATTACTGACTTGATGGCGTAA CTA	] Take reads that make up a contig and line them up
	Take consensus, i.e. majority vote
TAGATTACACAGATTACTGACTTGATGGCGTAA CTA	

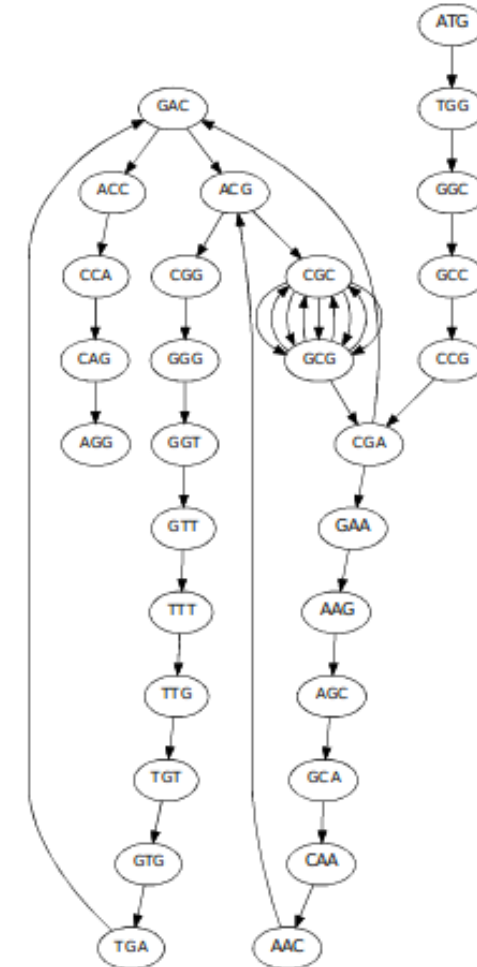

# Assembly: Algorithms

- **De Bruijn Graph (DBG: k-mer graph)**

Chopping reads into much shorter k-mers (fixed length fragments) and then using all the k-mers to form a DBG and infer the contigs.

- Nodes in the graph are k-mers
- Edges represent consecutive k-mers (which overlap by k-n symbols)

Ex. SPAdes, ABySS, Velvet, AllPaths, Soap....

# de Bruijn Graphs

- A directed graph of sequences of symbols
- Nodes in the graph are k-mers
- Edges represent consecutive k-mers (which overlap by k-1 symbols)

Consider the 2 symbol alphabet (0 & 1) de Bruijn Graph for k = 3

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# Producing sequences

- Sequences of symbols are produced by moving through the graph

e.g. 111000 = 111 -> 110 -> 100 -> 000

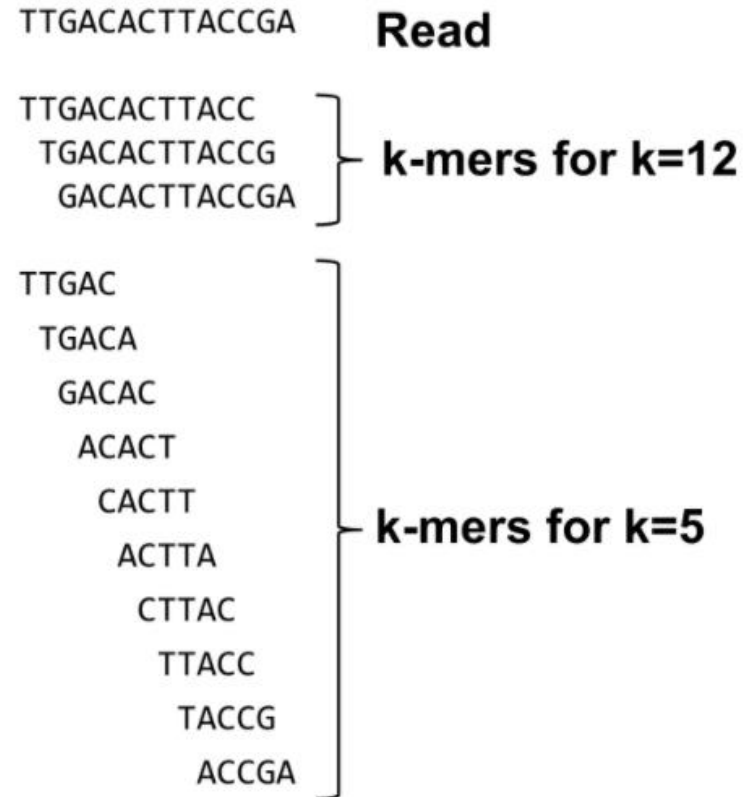

```
1 1 1
  1 1 0
    1 0 0
      0 0 0
-----
1 1 1 0 0 0
```

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# What are K-mers?

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# K-mers de Bruijn graph

This time  $k = 5$  k-mers:

MISSI ISSIS SSISS SISSI SSIPP SIPPI

MISSISSIS

SSIPPI

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# Choose k wisely

- Lower k
  - More connections
  - Less chance of resolving small repeats
  - Higher k-mer coverage
- Higher k
  - Less connections
  - More chance of resolving small repeats
  - Lower k-mer coverage

*Optimum value for k will balance these effects.*

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# Read errors

Example #3:

HAPPI INESS APLIN PINET

k = 3 k-mers:

HAP APP PPI INE NES ESS APL PLI LIN PIN NET

6 contigs: HAP APPIN APLIN INE NESS NET

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# More coverage

- Errors won't be duplicated in every read
- Most reads will be error free
- We can count the frequency of each k-mer
- Annotate the graph with the frequencies
- Use the frequency data to clean the de Bruijn graph

***More coverage depth will help overcome errors!***

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# SPAdes

- de Bruijn graph assembler by Pavel Pevzner's group out of St. Petersburg
- Uses multiple k-mers to build the graph
  - Graph has connectivity **and** specificity
  - Usually use a low, medium and high k-mer size together.
- Performs error correction on the reads first
- Maps reads back to the contigs and scaffolds as a check
- Under active development
- Much slower than Velvet
- Should be used in preference to Velvet now.

<https://galaxyproject.github.io/training-material/topics/assembly/tutorials/debruijn-graph-assembly/slides.html#1>

# Assembly: Scaffolding

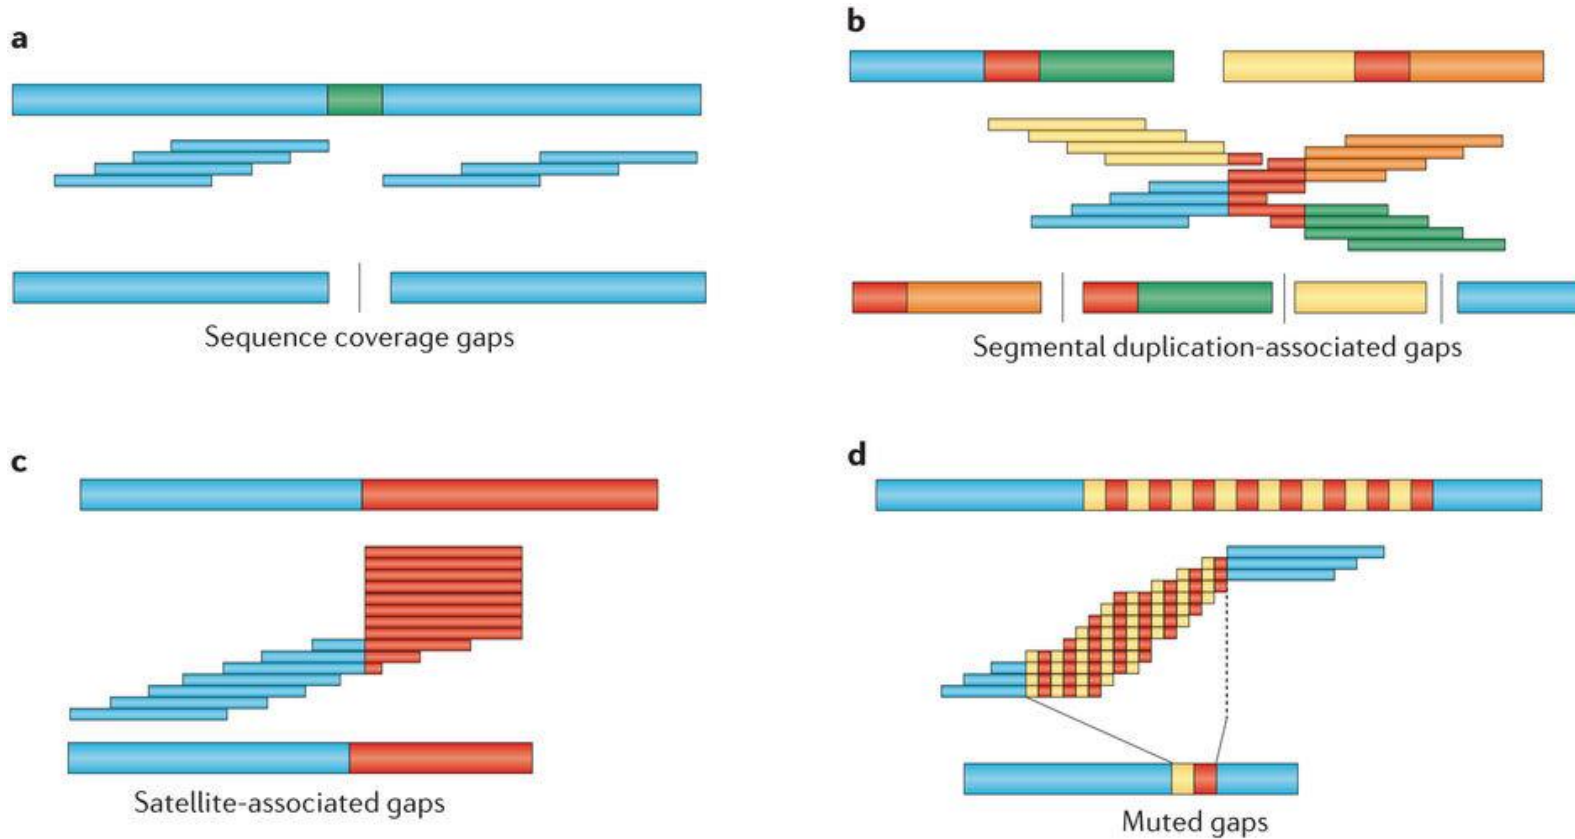

- **From draft:**
  - Order contigs** (Nucmer, if there is reference it can be used to align and guide)
  - Fill the GAPS** (GapFiller, fill sequencing gap (not physical gap))
  - Solve repeated** sequence ambiguities (Expander)
  - Resequence** with different library:
    - Longer fragments and/or distance
- **Tools for assembly improvement**
  - SSPACE (Scaffolding) REAPR (evaluate scaffolding, breaking incorrect scaffolds)
- **Assembly visualizing**
  - Artemis, ACT (compare two or more sequences), Icarus (Quast)

# A move back to OLC

- New long read technologies
  - PacBio and MinIon
- Assemblers: HGap, CANU
  - Use overlap, layout consensus approach
- CANU can perform hybrid assemblies with long and short reads

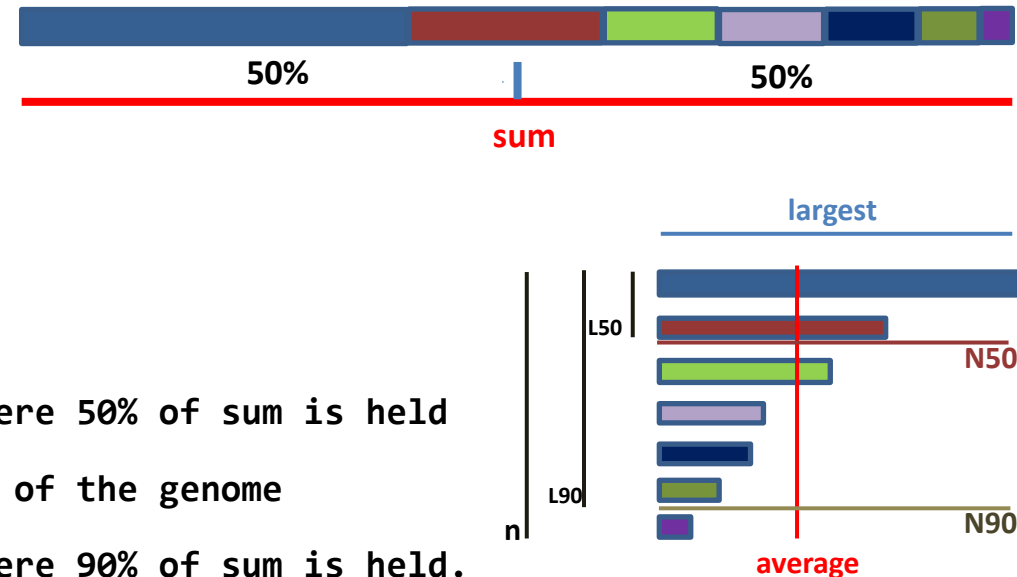

# Ensamblado: Errores

- **A. Gaps** – región del genoma sin secuenciar
- **B. Duplicaciones de gran tamaño**
  - Quimeras
- **Regiones repetidas colapsadas**
  - **C. Terminales**
  - **D. Intersticiales**

# Assembly: Metrics

- `sum` = total bases number
- `n` = contigs number
- `average` = average contig length
- `largest` = largest contig
- `N50` = length of the shortest contig where 50% of `sum` is held
- `L50` = number of contigs which have 50% of the genome
- `N90` = length of the shortest contig where 90% of `sum` is held.
- `L90` = number of contigs which have 90% of the genome

# Assembly: Evaluation

- Software that evaluate differets algorithms & parameters  
iMetAMOS, *Koren et al.*, *BMCBioinformatics* 2014, 15:126  
GAGE-B, *Magoc et al.*, *Bioinformatics* 2013,29(14):1718-25
- **Graph evaluation:** Bandage, Wick R.R., Schultz M.B., Zobel J. & Holt K.E. (2015)
- **Assembly evaluation:** Quast, *Gurevich et al.*, *Bioinformatics* 2013, 29:8
- **Metrics for a good assembly:**  
Large N50  
Sum closest to expected  
Low n  
Low L50

# Hybrid genome assembly – short and long reads

[https://en.wikipedia.org/wiki/Hybrid\\_genome\\_assembly](https://en.wikipedia.org/wiki/Hybrid_genome_assembly)

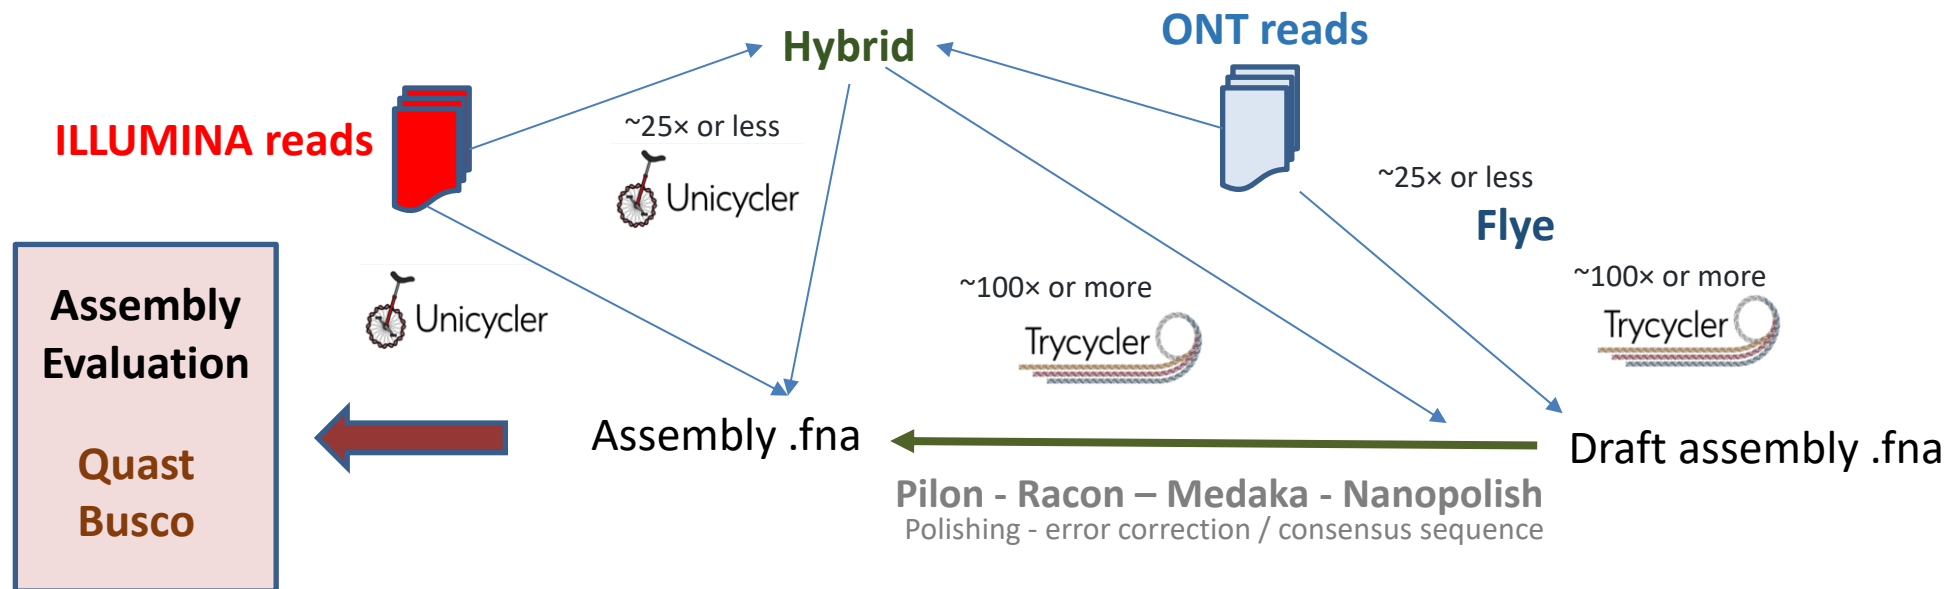

# Hybrid genome assembly - nanopore and illumina

Short reads (ILLUMINA) + Long reads (ONT) → **deNovo assembly** (De novo assembly is the process of assembling a genome from scratch using only the sequenced reads as input - no reference genome is used.) → **high-quality assembly**

ONT: >40.000b, higher error rate – **genome structure**

ILLUMINA: 300b, lower error rate – **high base-level accuracy**

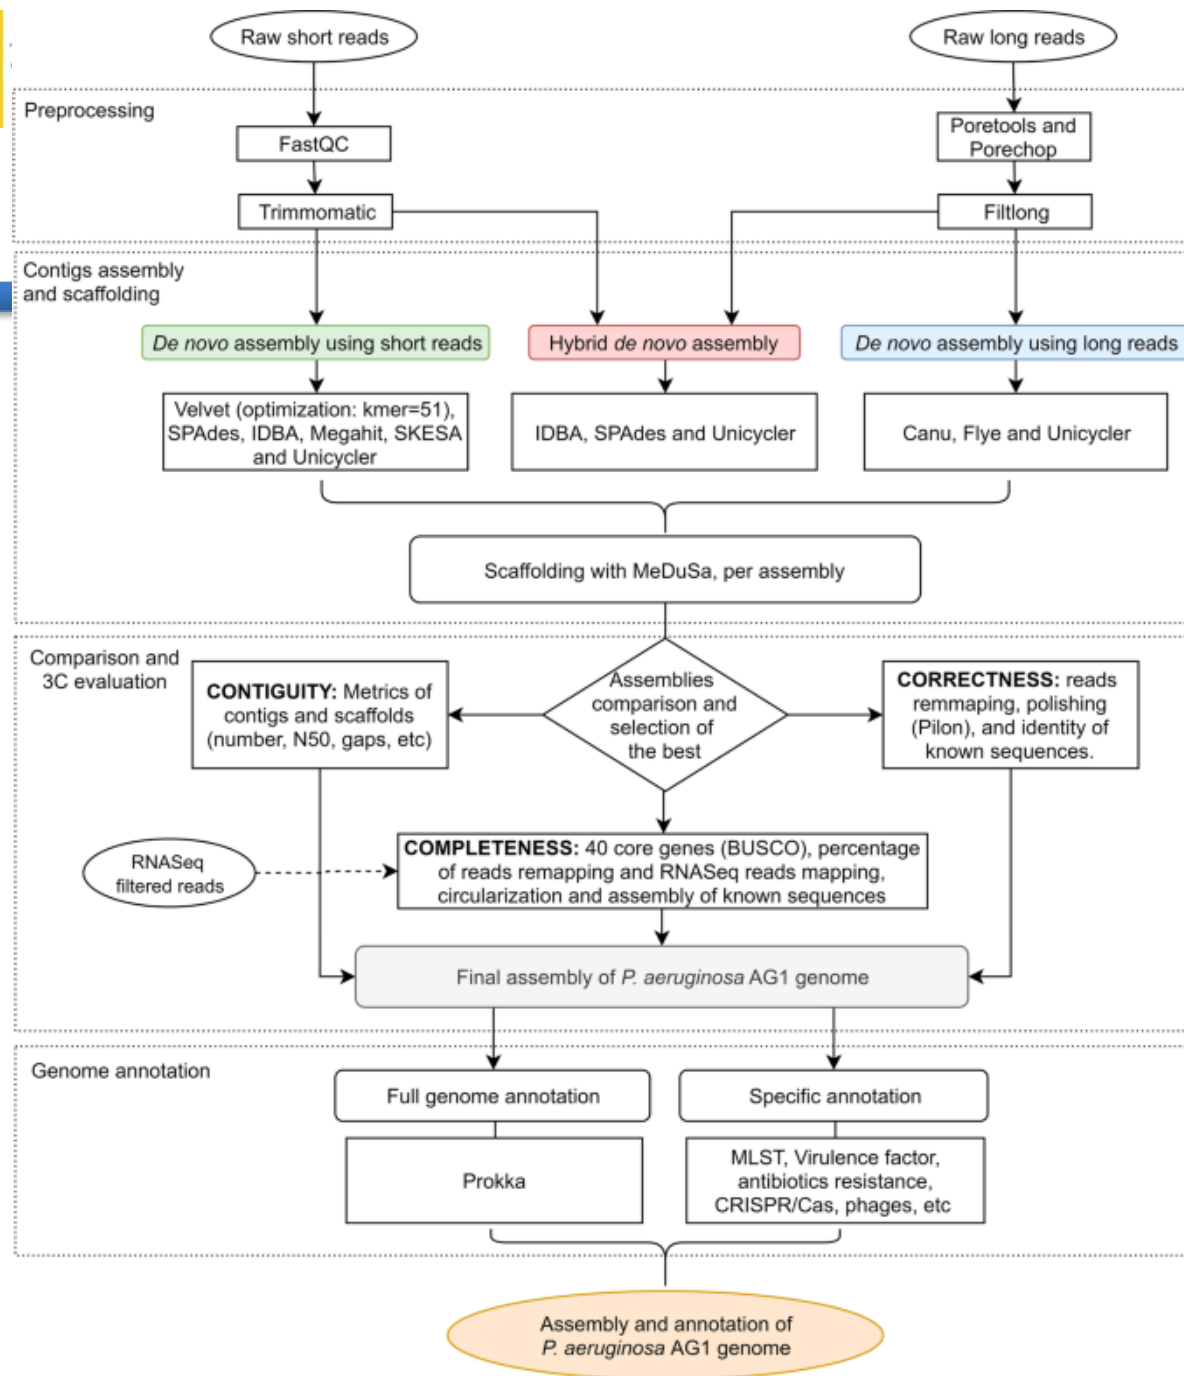

Higher COST
